

LoRaWan tutorial : Register a device on TTN V3

F. Ferrero, Professor @UCA

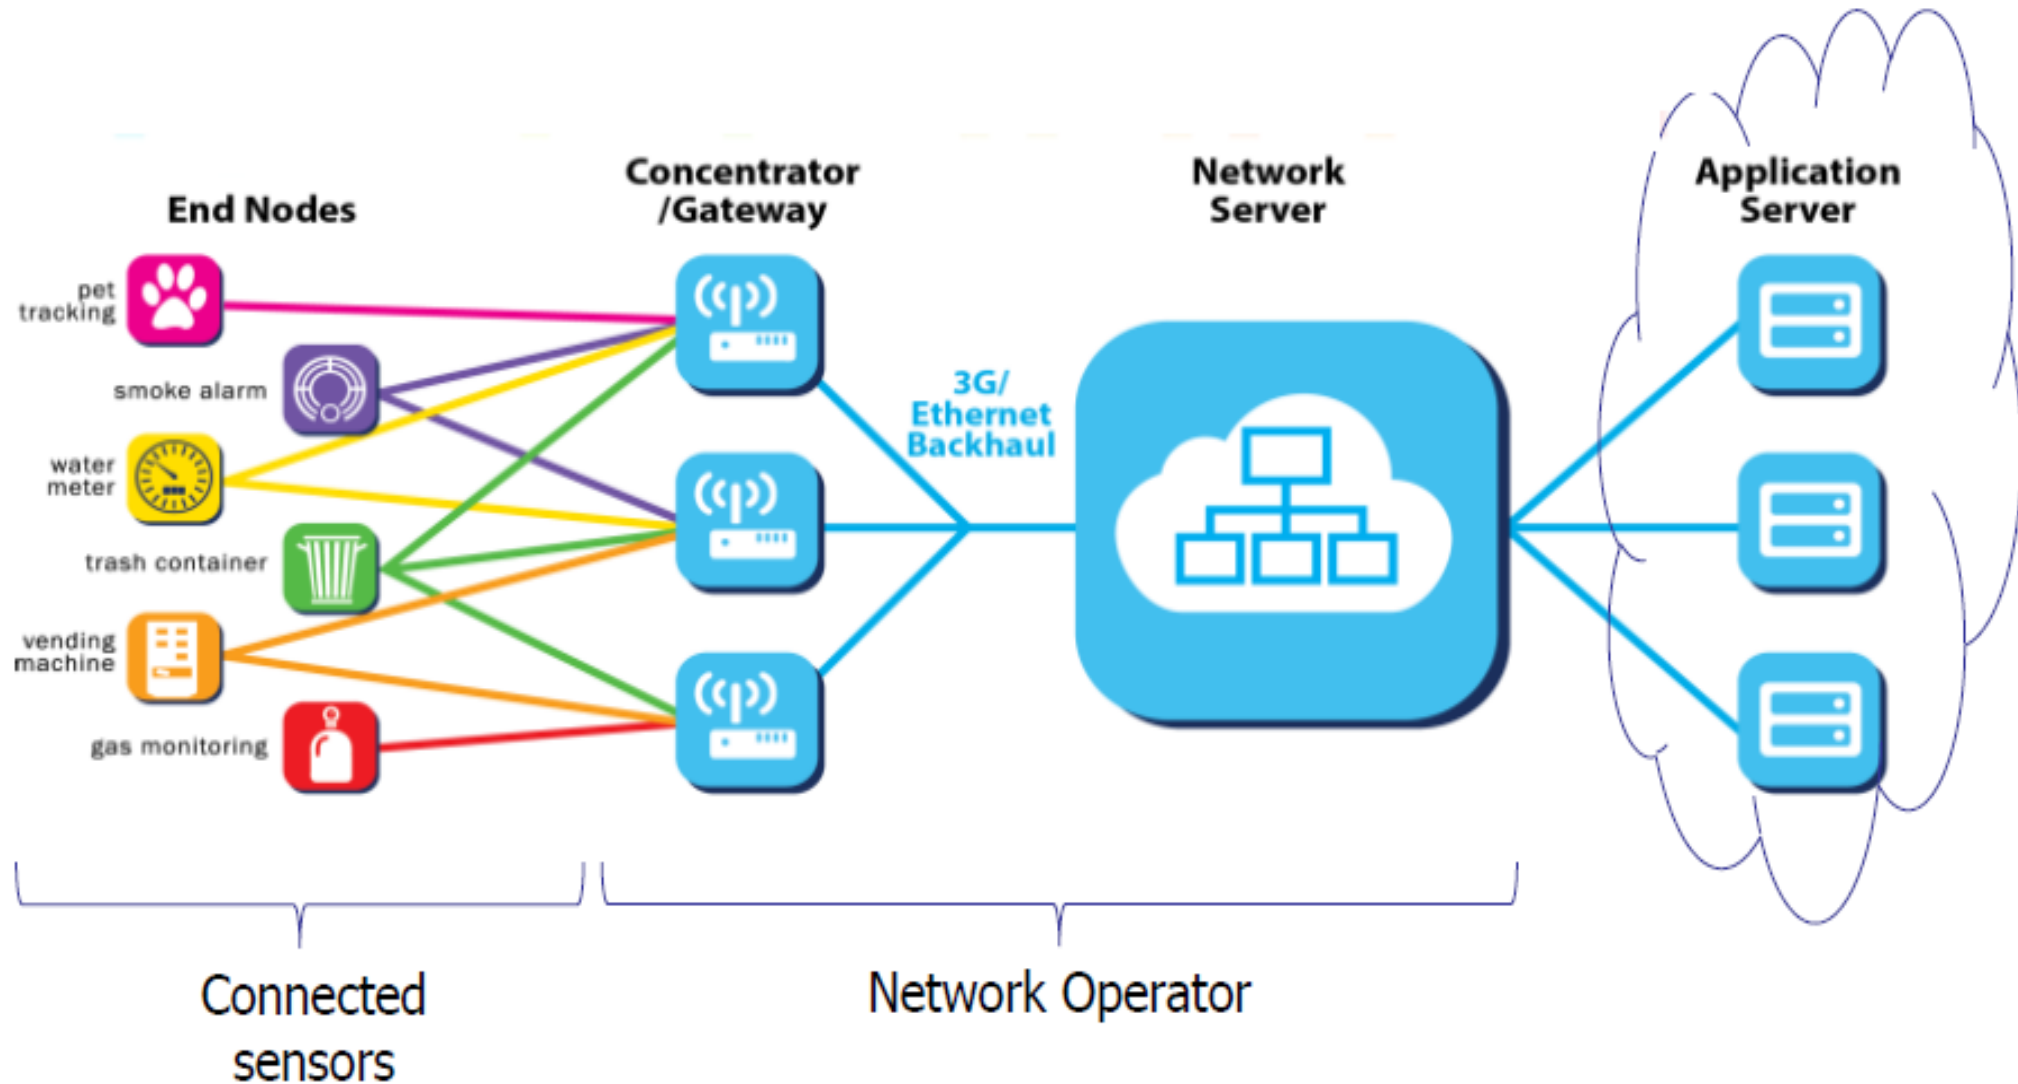

LoRaWan Tutorial Objectives

In this tutorial, you will :

- Use the UCA Education Board
- Program a microcontroller in C with Arduino IDE
- Register the board to a network server
- Transmit data with LoRa modulation
- Push data to an application server

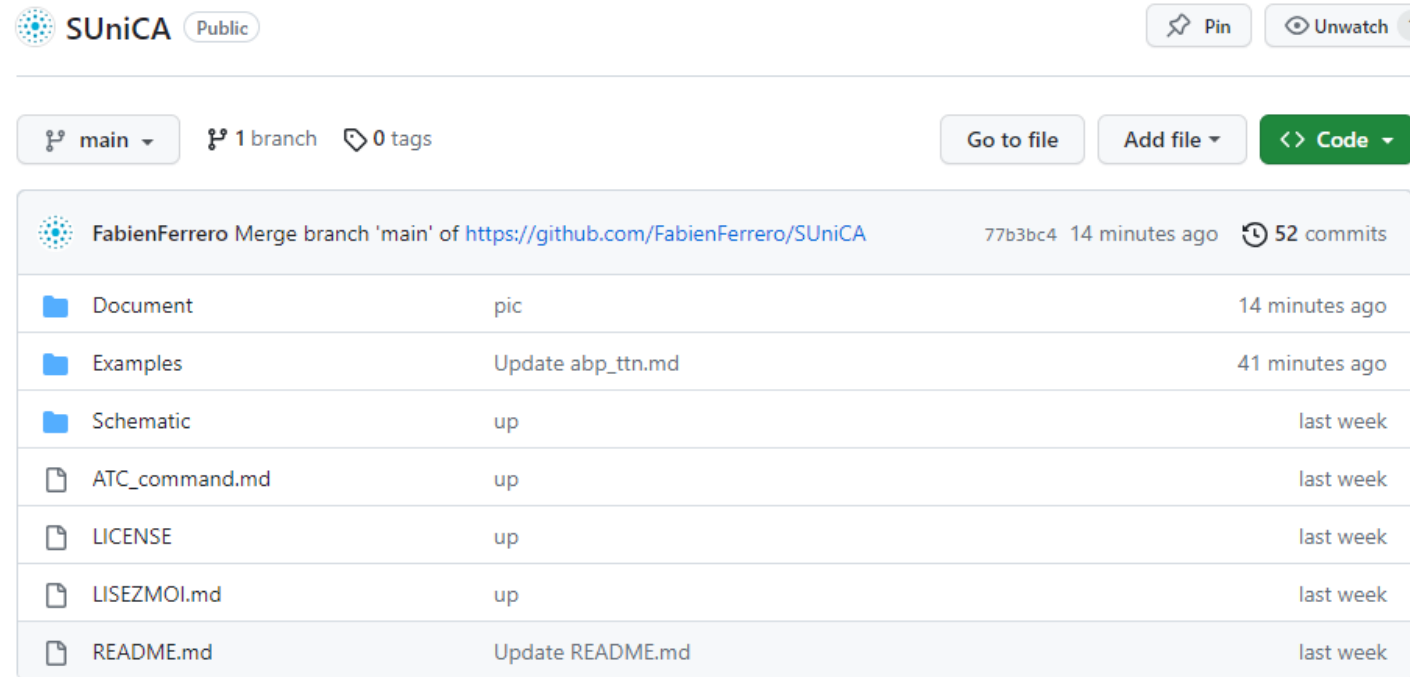

LoRaWan Tutorial Objectives

Downloading Arduino code on Github

- For this tutorial, you are going to use Arduino codes
- Codes are available on : <https://github.com/FabienFerro/SUniCA>
- You can click on “Clone or Dowload” and “download zip”
- Then unzip it
- If you are using Github Desktop, you can use “open in Desktop”

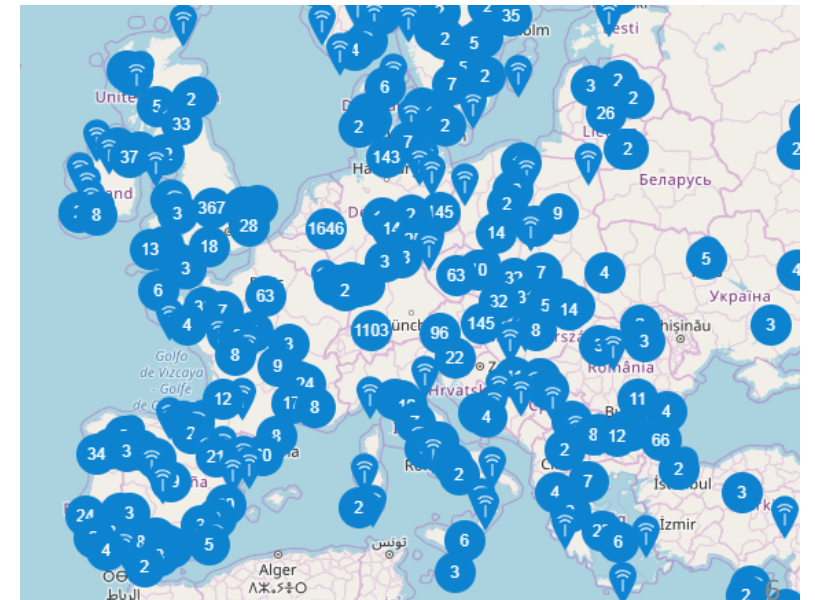

Configuring your Arduino IDE

- After downloading the archive (.zip) and extracting the archive
- Follow the tutorial on this link :
[#board-programming---board-manager](#)
- If your using Windows or Mac, your may need to install the board USB driver (CH340C) : drivers are available [here](#)

LoRaWan with The Thing Network

- The Things Network is a **global**, open, crowd-sourced Internet of Things data network.
- **The Things Network Backend** route messages from Nodes to the right Application, and back
- TTN is free
- 10000 LoRa gateways are connected to TTN around the world
- Any TTN can use any GWs, it is a collaborative network

Create a TTN account

- First, you have to [register](https://www.thethingsnetwork.org/) to <https://www.thethingsnetwork.org/>
- You can choose a student account
- You can also join a local community :

[TTN Côte d’Azur](#)

[TTN Da Nang](#)

CREATE AN ACCOUNT

Create an account for The Things Network and start exploring the world of Internet of Things with us.

USERNAME
This will be your username — pick a good one because you will **not** be able to change it.

EMAIL ADDRESS
You will receive a confirmation email, as well as occasional account related emails. If this email address is managed by a third party (such as for corporate email addresses), this third party might block emails coming from The Things Network. This email address is not public.

PASSWORD
Use at least 6 characters.

NEWSLETTER
Subscribe to the newsletter. ☐

Create account

Create an TTN application

- Click on **+Add Application**
- Choose an application ID and name
- Click on create application
- In the application, click on :
payload formater -> Uplink
- Choose CayenneLPP as formatter type

Add application

Application ID *

my-new-application

Application name

My new application

Description

Description for my new application

Optional application description; can also be used to save notes about the application

Save changes

Adding a new device

- Click on « + Add end device »
- Select « Manually » for configuration
- Click on « Show advanced activation, LoRaWAN class and cluster settings_»
- Select « ABP »
- Add « 0000000000 » in Join EUI server
- Generate DevEUI, Dev Adr, AppSkey, NetwSkey
- Choose a name for End Device ID
- Click on « Register end device » ! It's done

The screenshot displays the 'UCA Project' interface. At the top, it shows the project name 'UCA Project' with ID 'uca-project' and statistics: 'Last seen info unavailable', '0 End devices', '1 Collaborator', and '0 API keys'. A 'Live data' section shows a timestamp '22:48:07' and a 'Create application' button. Below this, the 'End devices (0)' section includes a search bar and buttons for 'Import end devices' and '+ Add end device'. The 'Register end device' form is shown with tabs for 'From The LoRaWAN Device Repository' and 'Manually'. The form includes dropdowns for 'LoRaWAN version' (MAC V1.0.3), 'Regional Parameters version' (PHY V1.0.3 REV A), and 'Frequency plan' (Europe 863-870 MHz). The 'Activation mode' section has radio buttons for 'Over the air activation (OTAA)', 'Activation by personalization (ABP)' (selected), and 'Define multicast group (ABP & Multicast)'. The 'Additional LoRaWAN class capabilities' dropdown is set to 'None (class A only)'. The 'Network defaults' section has a checked checkbox for 'Use network's Rx and frequency defaults'.

LoRaWAN version ⓘ *

MAC V1.0.3

Regional Parameters version ⓘ *

PHY V1.0.3 REV A

Frequency plan ⓘ *

Europe 863-870 MHz (SF9 for RX2 - recommended)

Show advanced activation, LoRaWAN class and cluster settings ^

Activation mode ⓘ *

☐ Over the air activation (OTAA)

☒ Activation by personalization (ABP)

☐ Define multicast group (ABP & Multicast)

Additional LoRaWAN class capabilities ⓘ

None (class A only)

Network defaults ⓘ

☒ Use network's Rx and frequency defaults

Activation by Personalization (ABP)

- Go to settings
- Select ABP and save
- Go back to Overview
- You have now the Device Address and the two 128 AES keys
- You can click on Hex-C Style to have the key in the right format

Session information

Device address

AppSKey

0x43, 0xB4, 0x29, 0x8D, 0x3...

msb ↔

Activation by Personalization (ABP)

- Open the code UCA21\Code\LORAWAN\ABP\Basic\UCA-ABP_Basic\UCA-ABP_Basic.ino
- Copy/Paste DEVADDR from your TTN window with « 0x » for Hex style
- Copy/Paste NWKSKEY and APPSKEY using C-style from your TTN window

```
#include <lmic.h>
#include <hal/hal.h>
#include <SPI.h>

// LoRaWAN end-device address (DevAddr)

static const u4_t DEVADDR = 0x00000000;

// LoRaWAN NwkSKey, network session key
// This is the default Semtech key, which is used by the early prototype TTN
// network.
static const PROGMEM u1_t NWKSKEY[16] = { 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00 };

// LoRaWAN AppSKey, application session key
// This is the default Semtech key, which is used by the early prototype TTN
// network.
static const u1_t PROGMEM APPSKEY[16] = { 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00 };
```

Activation by Personalization (ABP)

- Follow this tutorial :
<https://github.com/FabienFerrero/SUniCA/blob/main/Examples/atcommand.md>
- Look at the TTN device overview
- Have look on Data
- For each uplink, you can look many details as RSSI, SNR, airtime, modulation, coding rate, GW ID, etc ...

Activation by Personalization (ABP)

Frame counter security

- If you reset your board (click on the right button on your board), the frame counter restart from 0
- TTN is no more receiving the data because of security protection.
- Click on « General setting» and expand « Network layer », expand « Advanced MAC settings »
- Enable « Reset Frame counter » options
- As you can see, frame counter is a security features to avoid replay attack (done by capturing and re-transmitting the messages)
- Frame counter can be disabled for debug test in Settings

Downlink

- Open your serial monitor
- In TTN messaging, go to downlink, add a payload like « BABA » and click on « Schedule downlink», and go to Data
- After the next uplink, you should see the number of byte received in downlink

```
Packet queued
41330173: EV_TXCOMPLETE (includes waiting for RX windows)
Received 2 bytes of payload
Payload Value : BABA
```

Overview			Live data	Messaging	Location	Payload formatters	Gener
			Data preview				
↓	22:43:24	Forward downlink data message	FPort: 1	Payload:	BA BA		

Activation by Personalization (ABP)

Change SF, power, payload ...

- At the end of the arduino code, you can find :

`LMIC_setDrTxpow(DR_SF12,14);`

- You can change Spreading Factor(SF) from DR_SF7 to DR_SF12
- You can change the power from 2 dBm to 20 dBm
- Payload is in mydata[], and you can change the text.
- You can convert the payload in Hex to normal text using this online [tool](#)
- Change SF and Payload text ! What is the effect on Time on Air ?

Using TagoIO to see you data

- Go to <https://tago.io/> and sign up
- Add a device by selecting LoRa/TheThingsNetwork and Cayenne LPP.
- Add a device and select « LoRaWAN TTI/TTN v3 »
- Select « Custom The Things Industries

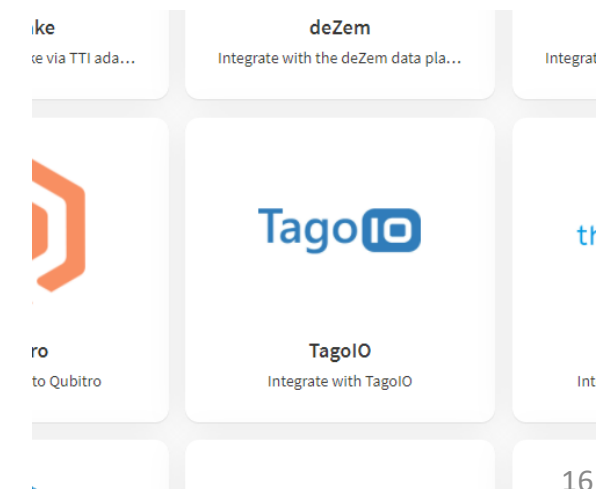

Using TagoIO to see you data

- Give a name to your device
- Add Device EUI
- Create an authorization and copy authorization

 **Service Authorization**
Create authorization to allow integration with other services. [Read more here.](#)

Name	Additional Parameter (Optional) 	Created at	Authorization 	
<input type="text" value="enter a name for this authorization"/>	<input type="text" value="enter an optional additional parameter"/>	<input type="text"/>	<input type="text"/>	<button>Generate</button>
TTN		il y a un jour	<input checked="" type="checkbox"/> Copied	<div><div></div><div></div></div>

- Go to TTN and click on Integration/Webhooks
- Click on « Add a Webhooks »
- Select TagoIO
- Enter a Webhooks ID (what you want) and copy authorization

Using TagIO to see you data

- Go to your dashboard and create a new normal dashboard
- Add a widget like a display
- Choose your Device and select a variable
- You can customize any widget and your dashboard.
- You can share your dashboard with
« Share Public »

Good luck for you projects !

This board as been funded by UCA
